

Naming & Tagging Standard

HEALTHCARE ANALYTICS CLOUD FOUNDATION

ALEJANDRA BADIA

DOCUMENT REVISION LOG

REV.	UPDATE DATE	BY
1	JULY 10, 2026	ALEJANDRA

1. Purpose

The Naming and Tagging Standard Document defines the naming convention and required tags for the Healthcare Analytics Cloud Foundation project.

2. Naming Convention

No.	Resource	Pattern	Example
1	Resource Group	rg-<org>-<platform>-<env>	rg-hfd-healthops-dev
2	Storage Account	st<org><platform><env>	sthfdhealthopsdev
3	Virtual Network	vnet-<org>-<platform>-<env>	vnet-hfd-healthops-dev
4	Application Registration	app-<org>-<platform>	app-hfd-healthops
5	Federated Credential (OIDC)	github-<org>-<platform>-<env>-<action>	github-hfd-healthops-dev-conn
6	Private Endpoint	pe-<org>-<platform>-<env>-<action>	pe-hfd-healthops-dev-blob
7	Storage Container	<platform>-<action>	healthops-data

Container & Folder Context Exemption: Root storage containers and directories inherit their corporate scope directly from their parent Storage Account parent resource. To optimize path length efficiency for big-data processing runtimes, organizational, regional, and environmental prefixes are stripped from internal storage containers, utilizing localized action descriptors instead.

3. Required Tags

These 8 foundational metadata keys are mandatory for all infrastructure assets deployed within the platform framework. They must be explicitly applied at the Resource Group level upon container creation, and replicated across all internal child resources (such as Virtual Networks and Storage Accounts) to ensure seamless corporate billing aggregation and operational compliance.

No.	Tag Name	Value	Purpose
1	Platform	Healthcare Operations Analytics Platform	Identifies the business platform supported by the resource.
2	Workload	Cloud Foundation	Identifies the architectural component or workload within the platform.
3	Environment	Development	Identifies the deployment environment.
4	Business Unit	Operations Analytics	Identifies the business function responsible for the platform.
5	Owner	Cloud Operations Team	Team responsible for managing the resource.
6	Cost Center	IT-Analytics	Enables financial reporting and budget allocation.
7	Data Classification	Internal	Indicates the sensitivity of the data handled by the resource.
8	Managed By	GitHub	Identifies the primary automation or management tool.

3. Naming Principles

- Use lowercase where required by Azure resource naming rules
- Use consistent abbreviations for resource types
- Include the environment identifier (e.g., dev, test, prod) in resource names where appropriate
- Avoid special characters unless supported by the specific Azure resource type
- Keep names concise while remaining meaningful
- Names should describe business purpose rather than technology wherever practical
