

Sprint Summary

Project Name: Healthcare Analytics Cloud Foundation

Environment Context: Development (dev)

Compute Paradigm: Serverless PaaS (Platform as a Service)

Sprint	Summary	Actions Executed	Tooling	Core Deliverables
Sprint 1	Identity Handshake & Workload Identity Federation (WIF)	Focuses on setting up local controls, establishing the cloud landing zone identity, and configuring the secure trust handshake with GitHub. - Local workspace and structured Git directories - App registration inside Microsoft Entra ID (formerly Azure Active Directory) to act as the cloud workload identity. - Passwordless configuration via OIDC (OpenID Connect) Federated Credentials inside Entra ID, pointing securely to the GitHub Repository branch - Github Actions workflow and validation to test and confirm the secure cloud authentication handshake	Git, Visual Studio Code (VS Code), Microsoft Entra ID Portal, GitHub Actions	App Registration (app-hfd-healthops) OIDC Federated Credential (github-hfd-healthops-dev-conn) validate-azure-identity.yml passing run.

Sprint	Summary	Actions Executed	Tooling	Core Deliverables
Sprint 2	Portal Implementation, Medallion Layout, & Secure Network Networking	Focuses on hands-on building, verifying network boundaries, structuring the lakehouse, and exporting the architecture. • Resource Group (RG) creation • Assign Azure RBAC (Role-Based Access Control) Contributor permissions at the Resource Group level • Virtual Network (VNet) setup with a custom Subnet (default) • Storage Account (ADLS Gen2 - Azure Data Lake Storage Gen2) setup with HNS (Hierarchical Namespace) enabled to support high-performance folder lookups • Medallion Architecture structure directory model inside the data container: /1-bronze (Raw Ingestion), /2-silver (Cleansed/Enriched), and /3-gold (Curated Reporting tables) to provision storage for Microsoft Fabric and Power BI • Private endpoint configuration for VNet and Storage Account • Private DNS (Domain Name System) Zone configuration to map local IP • Storage firewall configuration to Deny by default to lock public internet access • Export Resource Group template of live environment configuration as a verbose ARM (Azure Resource Manager) JSON (JavaScript Object Notation) template	Azure Portal Graphical User Interface (UI), Azure Resource Export Engine	Resource Group (rg-hfd-healthops-dev) Virtual Network (vnet-hfd-healthops-dev) Storage Account (sthfdhealthopsdev) Storage Container (healthops-data) Private Endpoint (pe-hfd-healthops-dev-blob) Exported JSON template of the active cloud environment.

Sprint	Summary	Actions Executed	Tooling	Core Deliverable / Artifact
Sprint 3	Bicep Decompilation, Naming Standardization, & Documentation Polish	Focuses on reverse-engineering the JSON blueprint, parameterizing parameters, and completing the portfolio documents. - Utilize raw exported ARM JSON template to create Bicep document (Infrastructure-as-Code) format with parametrization - Finalize all technical deliverables, including updating the SAD (Solution Architecture Document), Charter, naming-tagging standards, Cost & Lifecycle strategy, and the ADL (Architecture Decision Log)	VS Code, Bicep CLI (Command Line Interface), Markdown	Standardized main.bicep repository code blueprint Finalized Documentation: Project-charter.pdf Architecture-decision-log.pdf Solution-architecture-document.pdf Naming-tagging-standard.pdf Cost-lifecycle-management.pdf Sprint-schedule.pdf
